## <<儿科病理骨闪烁扫描法图谱 Atla>>

### 内容概要

This atlas covers both the common and the less common pathologies affecting the paediatric skeleton, providing illustrations, teaching points, technical comments, and text discussion. Variations in the appearances of osteomyelitis are also extensively illustrated. The procedures employed to create the images presented in this volume include whole body scanning, gamma camera high resolution spot images, pin hole and SPECT. Three phase bone scans are also illustrated. Indications for the use of each procedure are discussed. The many illustrations in this atlas offer the paediatrician, orthopaedic surgeon, radiologist and nuclear medicine physician the opportunity to compare them with their own images or with the "normal" images presented in the previous companion volume.
