

<<基因的表达与调控>>

图书基本信息

书名：<<基因的表达与调控>>

13位ISBN编号：9787040176759

10位ISBN编号：7040176750

出版时间：2006-12

出版范围：高等教育

作者：马骏

页数：582

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

## 前言

All genes must be expressed to exhibit their biological activities. How genes are expressed and regulated is a central question in molecular biology and our knowledge in this area has been expanding enormously in recent years. The complexity of gene regulation is compounded by the fact that gene activities reach every corner of biology. Transcription is universally the first step toward expressing a gene. It is a highly regulated process.

Understanding the molecular mechanisms of transcription regulation is of fundamental importance. For protein-coding genes, post-transcriptional steps, including pre-mRNA processing, mRNA transport and translation, can also play important roles in regulating gene expression. To contain the scope of this book, we will focus primarily on RNA polymerase II transcription and regulation. We will explore not only the biochemical basis of transcription but also the biological consequences of, and biological influences on gene transcription.

The book is composed of 35 individual review articles written by authorities in the field. The chapters are organized into five sections: The History, The Machinery, The Regulators, The Genome, and Special Topics. The History section contains one chapter, written by James Goodrich and Robert Tjian, who provide an excellent historical perspective and overview of the transcription process. The Machinery section has six chapters that cover essential topics on the transcriptional apparatus, general cofactors, chromatin structure, and core promoter structure. The Regulators section has thirteen chapters. While the first two of them investigate the mechanisms of transcriptional activation and repression, the remaining eleven chapters discuss in depth selected gene-specific transcription factors that play critical roles in a variety of biological processes, including STATs, Smads, NF- $\kappa$ B, nuclear receptors, NFAT, Rb, p53, HIV Tat, ATFs, c-Jun and Hox proteins. The Genome section contains six chapters that examine topics relevant to transcription regulation and genome behavior, including chromatin boundaries, heterochromatin, DNA methylation, genomic analysis, genomic integrity, and cell death. Finally, the Special Topics section contains nine chapters that investigate such important issues as pre-mRNA splicing, DNA supercoiling, microRNA, transcription factor dynamics, role of actin in transcription, gene therapy, and transcription regulation in bacteria, plants and developmental signaling.

When Higher Education Press invited me to write a textbook for their Current Scientific Frontiers book series two years ago, I did not think I had the time needed to tackle such a big project. Instead, I made a proposal—endorsed quickly by HEP—to explore the possibility of editing a book (resembling a textbook style) on the topic of gene expression and regulation, with individual review articles written by experts in the field. Without the enthusiastic support and generous commitment from the contributors, this project would have never even started. I am deeply indebted to all of them. Every chapter in this book is a scholarly work reflecting numerous hours of intense efforts of the contributors. I would like to express my special thanks to Cheng-Ming Chiang for generously contributing two excellent chapters, a few contributors for kindly agreeing to write on relatively short notice, and Gordon Hager for providing the cover photo and design suggestions. I would also like to thank HEP for their flexibility and trust in this project, and the HEP and Springer editorial and design teams, in particular Li Shen at HEP, for their excellent work. Finally, I would like to thank Bingxiang Li at HEP for the countless email communications and her hard work—atevery step along the way—that made this book a reality.

## <<基因的表达与调控>>

### 内容概要

This book offers a comprehensive look into the science of gene expression and regulation. Focusing on topics such as actions of nuclear receptors, RNA processing, and DNA methylation and imprinting, Gene Expression and Regulation is edited by a leading biologist and includes contributions by experts in the field.

作者简介

Jun Ma is an Associate Professor at the Division of Developmental Biology , Cincinnati Childrens Hospital Research Foundation and University of Cincinnati College of Medicine. He graduated from Peking University in 1982 , majoring in Biology. He did his graduate work with Mark Ptashne at the Department of Biochemistry and Molecular Biology in Harvard University , and was a Junior Fellow at the Harvard Society of Fellows between 1989-1992. He spent the summer of 1988 in the laboratory of Christiane Nüsslein-Volhard at the Max-Planck-Institute for Developmental Biology in Tübingen to collaborate with Wolfgang Driever. He joined the faculty of the University of Cincinnati College of Medicine in 1992 and has remained there since. Currently he also has a collaborative base at the Institute of Biophysics of the Chinese Academy of Sciences in Beijing. His earlier work on the yeast activator GAL4 helped pave the way to the development of the yeast two-hybrid system. His current research focuses on the mechanisms of transcription control and development in *Drosophila*.

## 书籍目录

About the EditorPrefaceSection The History Chapter 01 Transcription: The Never Ending StorySection  
The Machinery Chapter 02 The General Transcription Machinery and Preinitiation Complex Formation  
Chapter 03 The Dynamic Association of RNA Polymerase II with Initiation, Elongation, and RNA Processing  
Factors during the Transcription Cycle Chapter 04 General Cofactors: TFIID, Mediator and USA Chapter 05  
Chromatin and Regulation of Gene Expression Chapter 06 HATs and HDACs 111 Chapter 07 Structure  
and Function of Core Promoter Elements in RNA Polymerase II TranscriptionSection The Regulators Chapter  
08 Transcriptional Activators and Activation Mechanisms Chapter 09 Transcriptional Repressors and  
Repression Mechanisms Chapter 10 STATs in Cytokine-mediated Transcriptional Regulation Chapter 11  
Transcriptional Regulation by Smads Chapter 12 The Rb and E2F Families of Proteins Chapter 13 c-Jun: A  
Complex Tale of a Simple Transcription Factor Chapter 14 HIV Tat and the Control of Transcriptional  
Elongation Chapter 15 Post-translational Modifications of the p53 Transcription Factor Chapter 16 Actions  
of Nuclear Receptors Chapter 17 NFAT and MEF2, Two Families of Calcium-dependent Transcription  
Regulators Chapter 18 Hox Genes Chapter 19 Nuclear Factor-kappa B Chapter 20 The ATF Transcription  
Factors in Cellular Adaptive ResponsesSection The Genome Chapter 21 Function and Mechanism of  
Chromatin Boundaries Chapter 22 Heterochromatin and X Inactivation Chapter 23 DNA Methylation  
Regulates Genomic Imprinting, X Inactivation, and Gene Expression during Mammalian Development Chapter  
24 Comparative Genomics of Tissue Specific Gene Expression Chapter 25 Transcription and Genomic  
Integrity Chapter 26 Cell Death and TranscriptionSection Special Topics Chapter 27 Pre-mRNA Splicing  
in Eukaryotic Cells Chapter 28 Genome Organization: The Effects of Transcription-driven DNA Supercoiling  
on Gene Expression Regulation Chapter 29 The Biogenesis and Function of MicroRNAs Chapter 30  
Transcription Factor Dynamics Chapter 31 Actin, Actin-Related Proteins and Actin-Binding Proteins in  
Transcriptional Control Chapter 32 Wnt Signaling and Transcriptional Regulation Chapter 33 Regulatory  
Mechanisms for Floral Organ Identity Specification in *Arabidopsis thaliana* Chapter 34 Transcription Control in  
Bacteria Chapter 35 Gene Therapy: Back to the Basics

<<基因的表达与调控>>

编辑推荐

Presented in the flowing five sections , this book covers a full spectrum of topics : The History; The Machinery; The Regulators; "the Genome; and Special Topics. The Machinery section covers the transcriptional apparatus and general transcription factors. The Regulators section examines selected gene-specific transcription factors important to regulating gene expression. The Genome section Covers issues relevant to the behavior of the genome in relation to gene regulation. The Special Topics section discusses several selected topics ranging from bacterial and plant gene expression to I ) NA topology and interference RNA. The book's focus is on scientific concepts and issues , rather than specific organisms or experimental approaches. Complete with more than 100 illustrations , Gene Expression and Regulation provides biologists with concise and comprehensive research outlined in chapters including : DNA Topology and Transcription Gene Expression in Plants Chromatin and Chromatin Remodeling Core Promoter Elements Bacterial Gene Regulation Transcription Factor Dynamics
