前言

This may sound like common sense, but unfortunately, many projects are started without a clear understanding of how the system will improve the business. The IS field is filled with thousands of buzzwords, fads, and trends (e.g., customer relationship management [CRM], radio frequency identification [RFID], mobile commerce, data mining). The promise of these innovations can appear so attractive that organizations begin projects even if they are not sure what value they offer, because they believe that the technologies are somehow important in their own right. A 2004 survey by the Standish Group found that just 28% of all corporate IS projects are successful. Most times, problems can be traced back to the very beginning of the SDLC where too little attention was given to identifying the business value and understanding the risks associated with the project. Does this mean that technical people should not recommend new systems projects ?

Absolutely not. In fact, the ideal situation is for both IT people (i.e., the experts in systems) and the business people (i.e., the experts in business) to work closely to find ways for technology to support business needs. In this way, organizations can leverage the exciting technologies that are available while ensuring that projects are based upon real business objectives, such as increasing sales, improving customer service, and decreasing operating expenses. Ultimately, information systems need to affect the organization's bottom line (in a positive way !

). In general, a project is a set of activities with a starting point and an ending point meant to create a system that brings value to the business. Project initiation begins when someone (or some group) in the organization (called the project sponsor) identifies some business value that can be gained from using information technology. The proposed project is described briefly using a technique called the system request, which is submitted to an approval committee for consideration. The approval committee reviews the system request and makes an initial determination, based on the information provided, of whether to investigate the proposed project or not. If so, the next step is the feasibility analysis.

章节摘录

插图：Systems Analysis and Design (SAD) is an exciting, active field in which analysts continually learn new techniques and approaches to develop systems more effectively and efficiently. However there is a core set of skills that all analysts need to know——no matter what approach or methodology is used. All information systems projects move through the four phases of planning, analysis, design, and implementation; all projects require analysts to gather requirements, model the business needs, and create blueprints for how the system should be built; and all projects require an understanding of organizational behavior concepts like change management and team building. This book captures the dynamic aspects of the field by keeping students focused on doing SAD while presenting the core set of skills that we feel every systems analyst needs to know today and in the future. This book builds on our professional experience as systems analysts and on our experience in teaching SAD in the classroom. This book will be of particular interest to instructors who have students do a major project as part of their course. Each chapter describes one part of the process, provides clear explanations on how to do it, gives a detailed example, and then has exercises for the students to practice. In this way, students can leave the course with experience that will form a rich foundation for further work as a systems analyst.

《系统分析与设计(英文版·第3版)》是系统分析与设计的经典著作，也是世界范围内最受欢迎的高校教材之一，被加州大学伯克利分校、普度大学、伊利诺伊大学（UIUC）、华盛顿大学等众多名校采用。

与一般同类图书不同的是，《系统分析与设计(英文版·第3版)》的作者在学术界和工业界都有着丰富的阅历。

全书的字里行间融入了作者在实际开发和分析系统时的经验心得，而且特别强调通过动手实践来理解和掌握系统分析与设计的精髓。

这种实战性主要体现在如下两个方面：从主题的安排来看，作者通过一个典型项目逐一阐述计划、分析、设计和实现整个软件开发生命周期中面临的关键问题，面向对象的概念与技术贯穿全书始终，专用一章讲述UML核心知识，并涵盖了UML2.0新版本、敏捷开发方法等最新内容；从小专题的设置来看，文中给出了来自业界一线的多“实战场景”，既讲述成功故事，也揭示失败教训，又给出了许多贴近实际的案例、模板和小练习。

《系统分析与设计(英文版·第3版)》配套网站提供更多小测验题、项目文档模板、教学用PPT和相关的资源链接。
