## &lt;&lt;典型群&gt;&gt;

## 内容概要

Ever since the year 1925 , when I succeeded in determining the characters of the semi-simple continuous groups by a combination of E. Cartans infinitesimal methods and I. Schurs integral procedure , I have looked toward the goal of deriving the decisive results for the most important of these groups by direct algebraic construction , in particular for the full group of all non-singular linear transformations and for the orthogonal group. Owing mainly to R. Brauers intervention and collaboration during the last few years , it now appears that I have in my hands all the tools necessary for this purpose. The task may be characterized precisely as follows : with respect to the assigned group of linear transformations in the underlying vector space , to decompose the space of tensors of given rank into its irreducible invariant subspaces.

作者简介

作者：（德国）韦尔（Hermann Weyl）

## 书籍目录

TABLE OF CONTENTS  
 PREFACE TO THE FIRST EDITION  
 PREFACE TO THE SECOND EDITION  
 CHAPTER I INTRODUCTION  
 1. Fields, rings, ideals, polynomials  
 2. Vector space  
 3. Orthogonal transformations, Euclidean vector geometry  
 4. Groups, Klein's Erlanger program  
 5. Quantities  
 6. Invariants and covariants  
 CHAPTER II VECTOR INVARIANTS  
 1. Remembrance of things past  
 2. The main propositions of the theory of invariants  
 A. FROST'S MAIN THEOREM  
 3. First example: the symmetric group  
 4. Capelli's identity  
 5. Reduction of the first main problem by means of Capelli's identities  
 6. Second example: the unimodular group  $GL(n, \mathbb{Q})$   
 7. Extension theorem  
 8. Third example: the group of step transformations  
 9. A general method for including contravariant arguments  
 10. Fourth example: the orthogonal group  
 B. A CLOSE-UP OF THE ORTHOGONAL GROUP  
 10. Cayley's rational parametrization of the orthogonal group  
 11. Formal orthogonal invariants  
 12. Arbitrary metric ground form  
 13. The infinitesimal standpoint  
 C. THE SECOND MAIN THEOREM  
 14. Statement of the proposition for the unimodular group  
 15. Capelli's formal congruence  
 16. Proof of the second main theorem for the unimodular group  
 17. The second main theorem for the unimodular group  
 CHAPTER III MATRIC ALGEBRAS AND GROUP RINGS  
 A. THEORY OF FULLY REDUCIBLE MATRIC ALGEBRAS  
 1. Fundamental notions concerning matric algebras. The Schur lemma  
 2. Preliminaries  
 3. Representations of a simple algebra  
 4. Wedderburn's theorem  
 5. The fully reducible matric algebra and its commutator algebra  
 B. THE RING OF A FINITE GROUP AND ITS COMMUTATOR ALGEBRA  
 6. Stating the problem  
 7. Full reducibility of the group ring  
 TABLE OF CONTENTS  
 8. Formal lemmas  
 9. Reciprocity between group ring and commutator algebra  
 10. A generalization  
 CHAPTER IV THE SYMMETRIC GROUP AND THE FULL LINEAR GROUP  
 1. Representation of a finite group in an algebraically closed field  
 2. The Young symmetrizers. A combinatorial lemma  
 3. The irreducible representations of the symmetric group  
 4. Decomposition of tensor space  
 5. Quantities. Expansion  
 CHAPTER V THE ORTHOGONAL GROUP  
 A. THE ENVELOPING ALGEBRA AND THE ORTHOGONAL IDEAL  
 1. Vector invariants of the unimodular group again  
 2. The enveloping algebra of the orthogonal group  
 3. Giving the result its formal setting  
 4. The orthogonal prime ideal  
 5. An abstract algebra related to the orthogonal group  
 B. THE IRREDUCIBLE REPRESENTATIONS  
 6. Decomposition by the trace operation  
 7. The irreducible representations of the full orthogonal group  
 C. THE PROPER ORTHOGONAL GROUP  
 8. Clifford's theorem  
 9. Representations of the proper orthogonal group  
 CHAPTER VI THE SYMPLECTIC GROUP  
 1. Vector invariants of the symplectic group  
 2. Parametrization and unitary restriction  
 3. Embedding algebra and representations of the symplectic group  
 CHAPTER VII CHARACTERS  
 1. Preliminaries about unitary transformations  
 2. Character for symmetrization or alternation alone  
 3. Averaging over a group  
 4. The volume element of the unitary group  
 5. Computation of the characters  
 6. The characters of  $GL(n)$ . Enumeration of covariants  
 7. A purely algebraic approach  
 8. Characters of the symplectic group  
 9. Characters of the orthogonal group  
 10. Decomposition and X-multiplication  
 11. The Poincaré polynomial.....
