

<<锅炉>>

图书基本信息

书名：<<锅炉>>

13位ISBN编号：9787560525310

10位ISBN编号：7560525318

出版时间：2008-1

出版时间：陕西西安交通大学

作者：车得福

页数：602

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

前言

It has long been my wish to write a textbook concerning boiler in English for senior college students. There are quite a few reasons for me to write this textbook. Xi'an Jiaotong University (XJTU) is the first institute in which the specialty of boiler was established in 1950s in China. Since then, a great number of students have graduated from this university, and they have become and will become the eminent engineers and scientists. Historically, the text-books compiled by the staff of this university have been adapted to the Chinese students. Both the graduates and the textbooks from this university have been widely recognized over the whole society of China. XJTU should continue to keep the leadership in textbook compilation and teaching reforms. English has in fact become a very international language. The writing of academic papers and technical reports in English is almost inevitable for the graduates, in particular, as China has become a member of WTO. It will be of great significance for the students to be familiar with the English terminology and expressions related to boiler as early as possible. Good English proficiency can be very helpful in job seeking. The Chinese edition of Boilers appeared in 2004. In this English edition, many features have been reserved. Nevertheless, the contents associated with material strength of pressure part, boiler setting and framework, auxiliary equipment have been eliminated, and a new chapter, Operation of Boiler has been added. The notation system throughout this book is retained for convenient reading of Chinese readers. This book can be used as a textbook after the students have learned fluid mechanics, engineering thermodynamics and heat transfer as prerequisites. I do not intend this book to be scientifically and technically complete. In particular, neither the correlations and diagrams nor the methods for design or operation of boiler presented in this book are of absolute authority. They are not the sole choice whenever a boiler is designed or operated. Any practical design or operation of a boiler shall refer to relevant handbooks or manuals. Besides, English is not my native tongue. Although I have the visiting, studying, working and living experiences in English-speaking countries, more or less inappropriate or incorrect expressions might have occurred throughout this book. I am very anxious about any possible misleading and misunderstanding. I am looking forward to having the corrections from all the readers of this book.

<<锅炉>>

内容概要

《锅炉--理论设计及运行》其内容包括：Introduction , Classification , Conditions and Specification , Fuels , Balances of Material and Heat等。

作者简介

Defu CHE , born in 1962 , obtained his Bachelor , Master and Doctoral Degrees in Thermal Engineering from Xi ' an Jiaotong University in 1983 , 1986 and 1990 respectively. During 1989-1990 he studied as a Ph.D. student in Department of Chemical and Materials Engineering , University of Auckland , New Zealand. During 1995 ~ 1996 he worked as a visiting scholar in Department of Mechanical , Aerospace and Nuclear Engineering , University of California , Los Angeles , USA. Now , he holds a professorship in Department of Thermal Engineering of Xi ' an Jiaotong University. His research interests include boiler and heat exchanger design , multiphase flow and heat transfer , combustion of fossil fuels and pollutant emission control , comprehensive utilization of low grade heat energy , CFD and CAD and so on. He is also the author or co-author of over 100 journal and conference papers and seven books.

书籍目录

Chapter 1 Introduction 1.1 Status of energy utilization 1.2 Boiler and its role playing in national economy
1.3 Basic components and general working processes of a boilerChapter 2 Classification, Conditions and
Specification 2.1 Classifications and types of boilers 2.2 Capacity, conditions and models 2.3 Brief
history of boiler 2.4 Technical economic indicesChapter 3 Fuels 3.1 Classifications and constituents of
fuels 3.2 Solid fuels 3.3 Liquid fuels 3.4 Gaseous fuelsChapter 4 Balances of Material and Heat
4.1 Air requirement for combustion 4.2 Combustion products and their calculations 4.3 Combustion
temperature and flue gas enthalpy 4.4 Heat balanceChapter 5 Firing Methods and Equipment 5.1
Fundamentals of combustion 5.2 Grate firing 5.3 Space firing 5.4 Fluidized bed combustion 5.5
Cyclone firingChapter 6 Fuel Preparation 6.1 Pulverized coal and characteristics 6.2 Pulverizers 6.3
Pulverizing systemChapter 7 Heat Transfer Components 7.1 Water-cooled wall, slag screen and
convective bank 7.2 Superheater and reheater 7.3 Economizers and air heatersChapter 8 Heat Transfer
Calculations 8.1 transfer of radiant surfaces 8.2 Heat transfer calculations of convective heating
surfacesChapter 9 Arrangements of Heating Surfaces and Thermal Performance Calculations 9.1 Heat
distribution system of a boiler 9.2 Determination of basic parameters 9.3 Arrangement of heating surfaces
and thermal calculationsChapter 10 External Fouling, Corrosion and Erosion of Heating Surfaces 10.1
Slagging and fouling 10.2 External corrosion of heating surfaces Chapter 11 Hydrodynamics of Natural
Circulation Boiler 11.1 Fundamentals of hydrodynamics of boiler 11.2 Principles of natural circulation
11.3 Hydrodynamic calculations of natural circulation 11.4 Reliability of natural circulationChapter 12
Hydrodynamics of Forced Flow Boiler 12.1 Hydrodynamic characteristics of once-through boiler
evaporating tube 12.2 Thermal maldistribution of parallel tubes 12.3 Fluid flow oscillation in evaporating
tube 12.4 Forced circulation and combined circulation boilersChapter 13 Heat Transfer inside Tube 13.1
The regimes of heat transfer 13.2 The critical heat flux condition in forced convection boiling 13.3
Determinations of Heat Transfer Coefficients in Various RegionsChapter 14 Water Treatment and Steam
Purification 14.1 Water conditions and treatment 14.2 Steam purificationChapter 15 Boiler Draft 15.1
Principles of draft calculation 15.2 Draft calculations of gas ductwork and air ductwork 15.3 Boiler
Chimney and draft devicesChapter 16 Operation of Boiler 16.1 Basic operating principles 16.2 Initial
commissioning 16.3 Variable pressure operation 16.4 Operation of drum type boilers 16.5 Operation
of once-through boilers 16.6 Operation of fluidized bed boilersReferencescc
