

<<统计力学基础>>

图书基本信息

书名：<<统计力学基础>>

13位ISBN编号：9789810244200

10位ISBN编号：9810244207

出版时间：2000-12

出版时间：Penguin

作者：Walecka, John Dirk; Bloch, Felix;

页数：302

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

内容概要

The 1952 Nobel physics laureate Felix Bloch (1905-83) was one of the titans of twentieth-century physics. He laid the fundamentals for the theory of solids and has been called the "father of solid-state physics." His numerous, valuable contributions include the theory of magnetism, measurement of the magnetic moment of the neutron, nuclear magnetic resonance, and the infrared problem in quantum electrodynamics. Statistical mechanics is a crucial subject which explores the understanding of the physical behaviour of many-body systems that create the world around us. Bloch's first-year graduate course at Stanford University was the highlight for several generations of students. Upon his retirement, he worked on a book based on the course. Unfortunately, at the time of his death, the writing was incomplete. This book has been prepared by Professor John Dirk Walecka from Bloch's unfinished masterpiece. It also includes three sets of Bloch's handwritten lecture notes (dating from 1949, 1969 and 1976), and details of lecture notes taken in 1976 by Brian Serot, who gave an invaluable opinion of the course from a student's perspective. All of Bloch's problem sets, some dating back to 1933, have been included. The book is accessible to anyone in the physical sciences at the advanced undergraduate level or the first-year graduate level.

书籍目录

Preface
 Second Preface
 Chapter I: Introduction and Basic Concepts
 Chapter II: Classical Physics 1. Hamilton's Equations 2. Phase Space 3. Liouville's Theorem
 Chapter III: The Statistical Ensemble 4. Distribution Function and Probability Density 5. Mean Values Additive Quantities 6. Time Dependence of the Phase Density
 Chapter IV: Thermal Equilibrium and The Canonical Distribution 7. Stationary Mean Values Conditions of Equilibrium 8. Constancy of the Distribution Function 9. The Canonical Distribution 10. Thermodynamic Functions 12. The Statistical Significance of Entropy
 Chapter V: Applications of Classical Statistics Energy Heat Capacity Entropy Free Energy Distribution in the μ Space 14. The Virial Theorem 15. The Equipartition Theorem 16. Examples Mean Kinetic Energy Diatomic Molecules Rigid Rotations Vibrations Solids Normal Coordinates Linear Chain Periodic Boundary Conditions Three-Dimensional Solid Black-Body Radiation 17. Magnetism
 Chapter VI: Quantum Statistics 18. Basic Elements of Quantum Mechanics 19. The Density Matrix 20. The Statistical Ensemble 21. Time Dependence of the Density Matrix 22. Thermal Equilibrium 23. The Canonical Distribution 24. Thermodynamic Functions and the Partition Function The Nernst Heat Theorem
 Chapter VII: Applications of Quantum Statistics 25. Ideal Monatomic Gases 26. Mean Energy of Harmonic Oscillator 27. Examples Diatomic Molecules Specific: Heat of Solids The Debye Approximation Black Body Radiation Magnetism Weiss Theory of Ferromagnetism Transition from Quantum to Classical Statistical Mechanics 28. Identical Particles 29. The Grand Canonical Ensemble 30. Fermi Statistics 31. Bose Statistics
 Appendix A: Canonical Transformations and Poisson Brackets
 Appendix B: General Proof of Liouville's Theorem
 Appendix C: Molecular Distributions
 Appendix D: Some Properties of Fourier Series
 Appendix E: Basic Texts and Monographs
 Problems
 Index
